

ABSTRACT

Procedure for a Mobile Unit to Log in with a Base Station, and Communication System

A method for logging a mobile part on at a base station comprises the steps of recognizing a logon situation (50, 52, 54), generating an identifier (58), transmitting (62) the identifier via a radio connection between the mobile part and the base station, and transmitting (78) a confirmation via the local connection between the mobile part and the base station. A communication system is configured for the implementation of such a method. The invention creates a simple and, at the same time, dependable possibility for logging a mobile part on at a base station.
